Resumo : Este Boletim nº 3 tem dados de colheitas de bagos efetuadas ontem, dia 1, de Valpaços e Vidago. Podemos verificar que as chuvas que caíram trouxeram alguma riqueza ácida, mantendo uma subida do teor alcoólico provável, isto é uma subida dos açúcares.

Estão assim os mostos, bastante equilibrados em termos de teor alcoólico provável e a acidez total, prometendo uma excelente colheita.
